xccedingly high frequency, quite dis-inctive from any other subaqueous ounds. While the cause of the highinctive from any other subsqueous ounds. While the cause of the high-sitched sound is known to the inventors. t cannot be divulged, since it would then the possible for German submarine con-structors to eliminate the source of the cell-tale sound waves and thus render wold the purpose of the detector installa-

With characteristic sound waves availsole, there remained the elimination of all other waves so that the desired counds would be available for determinaion of the distance of the submarine tion of the distance of the submarine and direction it was traveling. It required several months of research work in developing suitable resonance tubes for filtering out all undesirable sounds, as well as a tikker or interrupter arrangement, which causes only the peaks of the desired sound waves to be heard in the telephone receivers that are used. The submarine boat placed at the disposal of the inventors by the French government was detected several miles.

The submarine boat placed at the disposal of the inventors by the French government was detected several miles away. It was found advisable to increase the range, and this was accomplished by the introduction of a De Forest audion amplifier, ultimately resulting in a range of fifty-five miles. The military value of the submarine detector system now used by France and England naturally prevents the disclosure of important details, it is stated; but it is learned that a number of special microphones are lowered to a depth of several fathoms, usually in a semicircle facing out to sea. Each microphone is so placed as to receive sound waves best in one direction. By slowly moving the switch over the several contacts the operator can determine from the microphone that responds the loudest the direction of the submarine. The system is not available for use on vessels because of its extreme sensitivity. There are said to be a larger number of installations for the detection of submarines along the coast of England, Scotland and Ireland, and along the French coast bordering on the English Channel and extending as far west as the Bay of Biscay. These stations are provided with means for advising fast topped-boat destroyers and armed motor boats of the presence of hostile submarines.

Tell of War Surgery

Up-to-the-minute war surgery re-cently was demonstrated before the New York Surgical Society by Dr. Wal-con Martin and Dr. H. M. Lyle, both late-

"There will be, therefore, much opposition to the departmental scheme of preparedness, so far as it relates to the army.

"One of the phases to which there is much objection is Mr. Garrison's plan for a continental army.

"It is considered in some quarters that it would be better to depend upon what has come to be known as the "Plattsburg plan." where intensified military training will furnish in a short period a competent fighting personnel, there being confidence in that worked out in five minutes.

of shell or other foreign bodies press Then, too, there is complaint that ing on the nerves and causing

Effective measures have been adopted that will shorten the career of these fiends of the sea, without weakening submarine-hunt-ing torpedo flotillas in more important areas. The Mediterranean, it is noted, is but so favorable to the action of ob-marines as are the Channel or the North Sea, owing to the clearer aunosphere, bet- Thackeray ter conditions of visibility, and trans-parence of the water. Most coasts eithe belong to the allies or are closely blockaded and watched by the allies, and it will not be easy for the pirates to re-plenish their fuel and supply stores. Therefore their unworths deeds will only be continued for a time and are likely to be visited with well-deserved punish-ment, as has happened in the North."
